

WintersvilleHS Website – How to Create a New Graduation Year

1. Introduction

This document defines the procedures for creating and maintaining a new graduation year for www.WintersvilleHS.com. The intended reader is a person that is interested in adding their Graduation Class to this site. This website was built by Pat Nuzum for his 1969 Classmates. This website is a spinoff from his original website (www.MySite10.com) which he developed for the purpose of renting it out to others. The basic requirement of MySite was to allow a customer to build their website from a free Cloud Service storage devices like:

- Microsoft OneDrive
- Google Drive
- DropBox
- Box

WintersvilleHS has a Download function on its main menu. This function downloads the files stored on one of these Cloud Services and builds a website. Only the people with the Username and Password can perform this download function. Since I am the Administrator of WintersvilleHS, I am the only one that can perform this download function. You would build your class's year in a file directory on your local PC. When you want to update your years section of WintersvilleHS, you would compress it to a zip file and email it to me. I would unzip it to the Cloud Service I use for WintersvilleHS, and then I would perform the Download Function, and your changes will be applied to our website. There are other options for getting me your zip file, depending on your needs.

2. Your Local File Folder(Directory) Structure

The root of the file directory must be named 'Class of 19XX with the 4-digit year of your graduation class (like 1943). In this folder, you can put whatever folder and files you want. The Folder Names will turn into Menu Names on the website's Leftside Navigation Bar. You can NOT use these special characters in folders and filenames(' \ / : * ? " < > |). Spaces are allowed

3. Videos

WintersvilleHS has a VIDEO function on the Main Menu. These are extremely large files and I am not going to allow other classes to put them on this site. My site does have the capability of accessing another website like YouTube Facebook, or whatever. So, you can access videos from your Photos folder.

4. Files

The bulk of the files will be picture type files. I just use '.jpg' files for all my pictures. All folder names and filenames are displayed alphabetically. When naming these folders and files, be aware of that.

4.1. Picture file size

You need to crop, resize, and/or compress your picture files so they look consistent and viewable (not too grainy or too small), but keeping the file size down to something between 200 to 300KB. This keeps the loading time of the files down, and increases the number of files we can keep in our free 5GB capacity Cloud Service. After that, we start getting charges for addition storage. My Class of 1969 currently has 1,200 files at just under 200MB (255 Classmates). I will be adding Class Year Reunions pictures as they occur. That gives us enough space for 25 classes.

4.2. Picture Gallery

When a menu is selected within the Photos section, all photos in that folder/menu will be displayed in a gallery format (7 photos per row), for as many photos that are in that folder. When you click on one of the gallery photos, it will expand and allow you to go forward or backwards. Click off the picture or the 'X' (upper right) will put you back in the Gallery mode.

When a picture is expanded, it has 4 options associated with it:

- No Caption – Nothing displayed in the caption line under the photo
- Caption – A caption is displayed in the caption line under the photo
- Website – A 'URL' is brought up in another browser page
- PDF – A .pdf file is displayed in another browser page

For the last two types, the user has to click on the words "image source" to perform this option. Clicking on these words can be difficult, especially if using a small smart phone. The gallery functions are from a piece of free s/w I got off of the internet, as was many of the other pieces of s/w I used. So, for now, that is how it works. I'm looking for something better in the future.

4.3. No Captions

These are .jpg files that you want displayed with no captions. All of the photos I copied from my Yearbook under the menu "Yearbook", don't have a caption.

4.4. Captions

To display a caption under the photo, create a .txt file that has the same name as the .jpg file. It must match in case too. I use Notepad to edit this file. Don't use something like Word that will embed hidden stuff. The .txt file must contain the following content:

{

```
"Title": "Type your caption here"
}
```

Type your caption between the double quotes.

4.5. Website

Like Captions there must be a .jpg and .txt file with the same name, and the .txt file with the following content:

```
{
  "Title": "Click image source to see video==>",
  "DataSource": "https://m.youtube.com/watch?v=0-syAstmzRM"
}
```

For the Title, you can put whatever words you want it to say, between the double quotes. For DataSource, you must put a valid url between the double quotes. The url in this example is a video I produced for one of my wife's class reunions. Take a look at it.

4.6. PDF

PDF (Portable Document Format) is what can be produced from a Word or Excel document. You create a Word or Excel document and save it, then save-as a .pdf file. I keep all my docx and xlsx files in the same folder as the resulting pdf. These docx and xlsx file will be ignored by my website. Keeping them together is good, because you only have one copy of the original, and when you change it, you save it at in the same location. We need to add two more files to these 2 file we've already discussed. Yes, you are right. A jpg and txt file. And "Yes", all of these 4 files must have the exact same filenames with the 4 different file extensions. The txt file must contain the following:

```
{
  "Title": "Click image source to see Document==>",
  "DataSource": "filename.pdf"
}
```

What you enter in this txt file should be clear at this time. Don't put a file path, and the filename must match the name of the pdf file.

5. That's all you have to do

Really, "That's All You Have To Do" Well, planning and defining how you want to organize your site, collecting photos, collecting names, copy/paste, renaming, and creating the Classmate Reference Documents is the bulk of your work. The Reference Document is an Excel document. The format and information in it was what I came up with. You do not have to use mine, and can do your own thing. I got a yearbook and contact list on a Saturday morning and at 7:00am on Monday morning I completed it. I'm in the process of collecting Reference information from my Classmates so I can update their Reference Excel Documents. I named

these files as given in the Yearbook (last name, first name). I can give you a zip file of my Photos/1969 folder so you can see how I organized things. However, I've been reorganizing it over the first week of operations. I started with grouping Classmates in last name letter like (A-B, C-E, etc.). Then I changed my mind and groped then (Deceased, Located, and Lost). We have no mailing address for people in the Lost group. Therefore, they do not have a Reference Document. Classmates in the Located may or may not have a Reference Doc.. To solve that problem, I create a side-by-side picture from the Reference Doc and use that in the Located folder. This way when the Gallery is displayed, it is easy to tell who has a Reference Doc and who does not. Again, that is what I did, I may decide to do things the way you do them. I'm looking forward to watching your Graduation Site grow and entertain our Classmates.
